# Maintenance sheet

## A. Troubleshooting

If the error code is indicated on the 7-Seg-LED on the PCB (Part #701) of the water heater (and/or the remote controller), refer to Section B.

#### << It takes long time to get hot water at the fixtures >>

- The time it takes to deliver hot water from the water heater to your fixtures depends on the length of piping between the two. The longer the distance or the bigger the pipes, the longer it will take to get hot water.
- If you would like to receive hot water to your fixtures quicker, you may want to consider a hot water recirculation system

ATD2 62S101

#### << The water is not hot enough or turns cold and stays cold >>

- Compare the flow and temperature. Refer to the "Output temperature chart" of the installation manual.
- · Check cross plumbing between cold water lines and hot water lines. • Check if the gas supply valve fully open, the gas line sized properly and the gas supplies pressure enough. Refer to the "Gas supply and gas pipe sizing" of the installation manual.
- Check the set temperature, and change the dipswitch setting. Refer to Section D.
- Refer to "Water circuit" in this section.

#### <<The water is too hot>>

### Check the set temperature, lower setting temperature.

<<The hot water is not available when a fixture is opened>> Refer to the "Power supply circuit" and "Water circuit" in this section.

#### <<Fluctuation in hot water temperature>>

- Check if the filter on the cold water inlet cleaned. (Part #406)
- Check if the gas line sized properly and the supply gas pressure sufficient. · Check for cross connection between cold water lines and hot water lines.
- Refer to "Water circuit" in this section.

#### <<Unit does not ignite when water goes through the water heater>>

- Refer to the "Power supply circuit" and "Water circuit" in this section. · If you use the remote controller, turn the power button on and then the green LED will
- light up
- Check if the filter on the cold water inlet cleaned. (Part #406)
- · Refer to "Water circuit" in this section.

## **B.** Error codes

#### 031: Incorrect dipswitch setting

Check the dipswitch settings on the PCB. Refer to Section **D**.

#### 101: Warning for the "991" error code

- · Check the gas type of the water heater. If it's wrong gas type model, replace the water heater to correct one.
- Check if there is any blockage (For example, Damper sticking, Vent Flaps installed on the terminator, Snow build up around terminator, Installed in a closet (No ventilation or lack of combustion air)) in the intake air and/or exhaust. Refer to the "Vent termination clearances" of the installation manual.
- · If the water heater is installed as a direct-vent system, check whether there is enough distance between the intake air terminal and the exhaust terminal. Refer to the "Vent termination clearances" of the installation manual.
- Check if the total yent length doesn't exceed 50 ft and the # of elbows is less than 5Fa · Check the altitude/elevation of area of where the water heater installed. Refer to the
- "High-altitude function" of the Section D. And change the dipswitch settings.
- $\cdot$  Check if there is grease and/or dirt in the burner (Part #101) and the fan motor (Part #103), especially if the water heater has been installed in a contaminated area. · Check if there is dust and lint in heat exchanger.
- · Check the manifold pressure of the water heater. Refer to installation manual.

#### 111: Ignition failure

- 1. Check gas supply and inlet gas pressure.
- 2. Check if the Hi-limit switch (Part #412) is properly functioning.
- 3. Check for connection/breakage of wires (Part #413, 708, 709, 712), burn marks on the computer board (Part #701), and/or soot on the flame rod (Part #108). And then if O.H.C.F (Part #413) is breakage, Consult the manufacturer.
- 4. Check if there is a buzzing spark ignition sound coming from the burner (Part #101) when water heater prepares for combustion.
- 5. Listen for the double "clunk" sound coming from the gas valve assembly (Part #102) when water heater goes into combustion.
- 6. (Only no sparking and/or kick sound) Check voltage on each wire to gas valves assembly (Part #102) and/or the igniter (Part #711). Refer to the "Appendix A" in Section C. \*No sparking sound >>>>> Refer to the #1 at "Appendix A" in Section C. >>>>> Refer to the #2 at "Appendix A" in Section C. \*No kick sound
- 7. Check if there is leaking from heat exchanger (Part #401)
- 8. Check if there is dust and lint in nozzles of the manifold (Part #102).
- 9. Check current on the flame rod (Part #108). Refer to the #3 at "Appendix A" in Section C.

#### 121: Loss of flame

- 1. Check gas supply and inlet gas pressure.
- 2. Check if the Hi-limit switch (Part #412) is properly functioning.
- 3. Check for connection/breakage of wires (Part #413, 708, 709, 712), burn marks on the computer board (Part #701), and/or soot on the flame rod (Part #108). And then if O.H.C.F (Part #413) is breakage, Consult the manufacturer.
- 4. Check if there is leakage from heat exchanger (Part #401).
- 5. Check if there is dust and lint in nozzles of the manifold (Part #102).
- 6. Check current on the flame rod (Part #108). Refer to the #3 at "Appendix A" in Section C.

#### <<The fan motor still spinning after operation has stopped>>

This is normal. After operation has stopped, the fan motor keeps running from 15 to 70 seconds in order to re-ignite quickly, as well as purge all the exhaust gas out of the flue.

#### <<Abnormal sound from water heater>>

An abnormal sound from the water heaters is caused by not enough air supply or wrong installations. The water heater needs more combustion air. Refer to the "101" error code in the section B

FM+

FM++

(2,000 to 4,000 ft)

(4,000 to 6,000 ft)

Consult the manufacturer

FM speed is increased automatically

Over 6,000 ft:

#### << Power supply circuit>>

- 1. If the remote controller installed, press the "ON/OFF" button of the remote controller, and make sure that the green LED on the "ON/OFF" button of the remote controller is lit. Restart the water heater.
- 2. Check if that the 7-Seg LED on the PCB (Part #701) of the water heater is lit. If so, the power supply circuit of the water heater is under normal condition. Next, refer to the "Water circuit" in this section.
- 3. Check the fuse on the surge box (Part #703), and if it has a brown spot, need to replace it.
- 4. Check the power supply, and make sure that the water heater has 120 VAC.
- 5. If the 7-Seg LED on the PCB (Part #701) isn't lit, some electrical parts can be broken. Consult the manufacturer.

### <<Water circuit>>

- 1. If you set the remote controller, turn the power button on and then the green LED will light up.
- 2. Open all hot water faucets, and make sure that there is enough water flow. This water heater needs at least 0.75 GPM water flow to operate.
- 3. Check for reverse connection and cross connection.
- 4. Check if the filter on the cold water inlet cleaned. (Part #406)
- 5. Check if there is no debris or obstruction on the fixtures.
- 6. Check if water ways in the water heater are frozen. If so, unfreeze them. And refer to installation manual to protect your water heater from freeze
- 7. Check if the inlet water pressure is higher than 40 psi. And if it's lower than 40 psi, need to increase the pressure.
- 8. Check for connections and breakage of wires (Part #402).
- 9. Check if the motor drive of the flow adjustment valve (Part #402) is locked due to scale buildup, and/or water leakage. Consult the manufacturer

#### 311,321,331: Disconnected/short-circuited thermistor

- Check for connection/breakage of wires and/or debris on thermistor (Part #407, 408, 411, 716).
- · Check thermistor resistance. Refer to the "Appendix D" in Section C.

#### **391: Air-fuel Ratio Rod failure**

- Check for connection/breakage of wires (Part #709) and/or soot on the AFR rod. (Part #108).
- 441: Flow Sensor failure (Only Easy-Link system) Check for connection/breakage of wires and/or debris on the flow sensor impeller (Part
  - #402.717)

#### 510: Abnormal Main and Solenoid Gas Valve

- Check for connection/breakage of wires (Part #708) and/or burn marks on the computer board (Part #701).
  - Reset power supply of the water heater.
- · Check voltage on the each valve on the gas valves assembly (Part #102). Refer to the "Annendix C" in Section C

#### 611: Fan motor fault

- · Check for connection/breakage of wires, dust buildup in the fan motor (Part #103) and/or burn marks on the computer board (Part #701).
- Check for frozen/corrosion of connectors of the fan motor (Part #103).
- · Check voltage between blue wire and each wire of the fan motor (Part #103), and check
- resistance between white wire and red wire. Refer to the **"Appendix B"** in Section **C**.

#### 651: Flow adjustment valve fault (Only Easy-Link system)

- Inspect the flow adjustment valve (Part #402), for connection/breakage of wires (Part
- #718), locked motor drive due to scale buildup, and/or water leakage.
- Check voltage between black wire and red wire. Refer to the "Appendix F" in Section C.

#### 701: Computer board fault

Check for connection/breakage of wires (Part #714) and/or burn marks on the computer board (Part #701).

#### 721: False flame detection

remote controller

991: Imperfect combustion

- 1. Clean the flame rod (Part #108).
- 2. For indoor models, check if condensate drain is installed on the vent collar of the water heater
- 3. Check if there is leaking from heat exchanger (Part #401).

"Easy-Link system" section in the Installation manual.

Refer to the "101" error code in this section.

#### 741: Miscommunication between water heater and remote controller

1. Check the model type of the remote controller. Model No. 9007603005 is the correct one. 2. Inspect the connections between the water heater and remote controller. Refer to the "Remote controller connections" of the Installation manual.

4. If this error code appears only the 7-Seg LED on the PCB (Part #701), check the voltage on

6. If this error code appears both the PCB (Part #701) and the remote controller, replace the

Check if the connections between the parent unit and the child units are correct. Refer to

the remote controller terminal on the PCB. Refer to the "Appendix E" in Section C.

5. If this error code appears only remote controller, replace the PCB (Part #701).

761: Miscommunication between Parent unit and Child units for Easy-link system

3. Check the power supply of the water heater.
