INTERCONNECT CABLE INSTALLATION INSTRUCTIONS

KICHLER®
LIGHTING SYSTEMS
SINCE 1938

Before Installing:
All installations should comply with National and local electrical codes.
If you have any doubts concerning installation contact a qualified, licensed electrician.

**NOTE:** Read all instructions thoroughly before starting installation.

1) For use only with Kichler® LED 24VDC Class 2, 5 AMP MAX Cabinet Lighting fixtures and Accessories.
2) Hold interconnect cable to mounting surface and determine best path for cable. If interconnect cable is being run from cabinet to cabinet a notch such as a "V" could be cut in cabinet side panels to help keep cable out of sight. (Ref. Fig. 2)
   NOTE: Interconnect cable is UL rated CL2. Installer should check with local building codes to determine if CL2 wire is allowed to run through floors, walls and ceilings.
3) Plug connector into end of LED fixture or accessory.
4) Peel backing off retaining clip(s) and affix to desired location(s). Surface should be as clean as possible. Drive pre-installed screw into the cabinet surface to secure the retaining clip to the surface.
   NOTE: DO NOT OVER TIGHTEN SCREWS.
5) Slip Cable into clip(s) and snap closed.
